CHAPTER 1	INTRODUCTION	1
1.1	Background	1
1.2	Objectives of Study	1
1.3	Methodology	2
1.3.1	House to House Survey	3
1.3.2	Secondary Collection Point Survey	3
1.3.3	Dumpsite Survey	4
1.3.4	Questionnaire Survey	4
CHAPTER 2	SOLID WASTE GENERATION SCENARIO OF DHAKA CITY	6
2.1	Organizational, Financial and Legal Aspects	6
2.2	Quantity of Solid Waste	6
2.3	Physical Composition of Solid Waste	8
2.4	Type of Plastic Waste Disposed in Dhaka	9
2.5	Types of Plastic Waste Disposed and Sold By Households in DCC Area	11
2.6	Average Consumption of Plastic in Dhaka City	12
2.7	Growth of Plastic Waste Over Last Ten Years in Dhaka	13
CHAPTER 3	PLASTIC WASTE RECYCLING SCENARIO OF DHAKA CITY	14
3.1	Methodology	14
3.2	Plastic Waste Recycling System in Dhaka City	14
3.3	Recycling Trade Chain	15
3.3.1	<i>Feriwallas</i>	15
3.3.2	Van Collectors	17
3.3.3	<i>Wastebin tokais</i>	19
3.3.4	DCC Collectors	21
3.3.5	<i>Dump site Tokai</i>	22
3.3.6	<i>Vangari dokan</i>	23
3.3.7	Brokers	25
3.3.8	Wholesalers	26
3.3.9	Manufacturers	28
3.4	Total Amount of Plastic Waste Recycled in Dhaka City	29
3.5	Employment Generated by Plastic Waste Recycling in Dhaka	31
CHAPTER 4	TECHNOLOGY USED FOR RECYCLING OF PLASTIC WASTE	32
4.1	Brief Introduction to Plastics	32

4.2	Mechanical Recycling Process	32
4.2.1	Collection	33
4.2.2	Cleaning and Drying	33
4.2.3	Sorting	33
4.2.4	Size Reduction	34
4.3	Recycling of Post Consumer Polypropylene (PP)	36
4.3.1	PP Container Making Factory	36
4.4	Recycling of Post Consumer PVC Flexible Tubes/Pipes	38
4.5	Recycling of Post Consumer HDPE and LDPE	40
4.5.1	Recycling of Post Consumer HDPE Containers	40
4.5.2	HDPE Pellet Making Factory	40
4.5.3	HDPE Pellet and Bodna Making Integrated Factory	41
4.5.4	HDPE Jerry Can Making Factory	41
4.5.5	Recycling of Post Consumer LDPE Films	44
4.5.6	Clean Post Consumer PE Film Factory	44
4.5.7	Sandal Factory Using Clean Post Consumer PE pellets	45
4.5.8	Contaminated Post Consumer PE Film Factory	45
4.5.9	Small-Container Making Factory	50
4.6	Recycling of Post Consumer PET Bottles and Containers	50
4.7	Mixed Contaminated Waste Plastics	50

CHAPTER 5 ECONOMICS OF PLASTIC RECYCLING 53

5.1	Introduction	53
5.2	Recycling- Developed vs. Developing Country	53
5.3	Costs of Different Stages of the Collection Chain	55
5.4	Plastics Processing Costs for Recycled and Virgin Resins	55
5.5	Market Analysis of Recycled Plastics	58
5.6	Profitability of Plastics Recycling	58
5.7	Economic Impact of Plastics Recycling	61
5.8	Factors Affecting Plastics Recycling	62
5.9	Export Potential of Recycled Plastic Pellets	63

CHAPTER 6 CONCLUSION AND RECOMMENDATION 65

6.1	Key Findings	65
6.2	Recommendations	65
6.2.1	Promotion of Environmental Management System (EMS) In the Plastic Industry	65
6.2.2.	Awareness Campaign for Source Separation of Plastic Waste from Other Municipal Waste	66
6.2.3	Pilot Intervention for Collection of Source Separated Plastic Waste in One Residential Area of Dhaka City	66
6.2.4.	Capacity Building Training Programs and Policy Intervention for Efficient Plastic Waste Recycling in Bangladesh	67

Executive Summary

This study has been commissioned by KATALYST- a project of European Donors for Bangladesh with a goal to improve competitiveness of business within sectors having ample opportunities. Plastic is one of the sector where KATALYST is working. The potentials of recycling of plastic waste have made it a growing business worldwide, both from economic and environmental point of view. In Bangladesh, especially in Dhaka, plastic waste recycling is based on rudimentary technology and dominated by informal sector. However, there is a dearth of information about composition of plastic waste and demand-supply scenario of recycled granules/ pellets.

In order to obtain in depth information about plastic waste composition as well as plastic waste recycling scenario in Dhaka, this study was launched and contracted out to Waste Concern Consultants- a specialized organization working in waste and environmental sector in Bangladesh for more than a decade.

In view of the above facts, this may be considered as a baseline study on plastic waste recycling in Dhaka city in particular and Bangladesh in general. This study is mainly based on primary data, as there was an acute lack of secondary data. The key findings of this study are as follows:

1. In DCC area 3315 tons of solid waste has been generated per day during 2005, of which 4.15% is composed of plastic materials. As such, 50,214 tons of plastic waste is disposed in the city at the rate of 137.57 tons/day.
2. Comparing the previous available date of 1992, with 2005 survey results, it indicates an increase of 10.43% per year in the amount of plastic waste. This also signifies that with the growth of economy of the country, the amount of plastic waste is also increasing. This trend in the growth of plastic waste is expected to continue in near future also.
3. This study also reveals that per capita plastic consumption in Dhaka city is 9 kg/year while the national average stands at 3.6 kg/cap/year, which is lower than the global average of 20 kg/cap/year.
4. From the field survey it has been found that 40.76 tons of unsoiled plastic is collected per day by *feriwallas* before it is disposed, while 50.24 tons/day of soiled plastic is retrieved by different actors (van collectors, waste bin *tokais*, DCC collectors and dumpsite *tokais*) from the disposed waste of 137.57 tons/day. Thus the total amount of plastic waste recycled per day in DCC area stands at 91 tons/day.
5. Price of plastic waste depends upon whether it is soiled or unsoiled. The more it becomes soiled the more its value falls sharply, rendering it difficult to recycle.
6. In terms of employment generation from plastic waste recycling in DCC area, this study has found that 22,792 persons are working in this trade, of which 13% is female. In terms of employed labor force of DCC area, it is 1% while it is 1.6% in terms of informal sector labor force.
7. Recycling of plastic waste in DCC area is saving Tk. 30.8 million per year by just avoiding waste transportation cost.
8. In terms of foreign currency savings, recycling of 33,215 tons/year of plastic waste is saving US \$ 51.1 million per year by avoiding import of virgin resin. With the increase in oil price globally, price of virgin resin is also going up.
9. Analyzing the plastic waste recycling sector from country perspective, this study has found that there is a demand for 540,000 tons of resin per year as raw material. However, total

resin used in the country in 2005 was 438,000 tons of which virgin resin (imported) was 40%, while the remaining 60% i.e., 263,000 tons was recycled resin. Use of recycled resin of 263,000 tons has saved import cost of US \$ 405 million, which is quite a substantial amount of foreign currency saving from Bangladesh's interest point of view.

10. Bangladesh does not have any polymer industry. Despite having abundant natural gas it is deficient in raw materials for polymer production. All virgin polymers are imported. As such, there is a rapidly growing incentive to recycle plastic waste, which is vital from environmentally sustainable perspective.
11. Although 51% of total plastic waste is recycled in DCC area, health safety and environmental issues are not properly looked after. This needs an urgent attention.
12. At least in the near future plastic waste recycling in Bangladesh will remain quite cost-effective due to our cheap and available labor force. Therefore, there is ample scope of improving standards without endangering the financial viability of plastic recycling industry.
13. The importance of plastic waste recycling industry to the economy of the country, by saving US \$ 400 million (with 51% recycling rate) without any sort of government support indicates that some measures need to be urgently taken to encourage and streamline this industry so that it does not fall into disrepute and lend itself to severe criticism from environmental activists.
14. Some recommendations have also been made to promote plastic waste recycling in the country so that higher plastic waste recycling efficiency can be attained from baseline scenario of 51%, while health, safety and related environmental issues are also properly addressed.
15. By increasing plastic waste recycling rate from 51 to 100 percent, and exporting this additional 49 percent recycled plastic granules foreign exchange of US \$ 29.42 million can be earned in DCC area alone. This is based on the assumption that local market is not able to absorb the additional 49 percent of the recycled granule by increasing the recycling rate from 51 to 100 percent. Similarly, in the country context increasing the plastic waste recycling rate from 60 to 100 percent can generate a revenue of US \$ 162 million by exporting the additional 40 percent of the plastic waste which is not being utilized at present.
16. It is recommended that more study should be carried out to identify potential markets for the export of recycled granules from Bangladesh.
